## File Geodatabase Feature Class

### Tags

Transportation, Manhattan, New York, Roads, Streets, Staten Island, Brooklyn, New York City, LION, Bronx, Highway, Richmond, Queens, Kings, transportation

### Summary

The LION file has been maintained as a major component of the Department of City Planning's Geosupport System.

### Description

LION is a single line representation of New York City streets containing address ranges and other information.

### Credits

Department of City Planning

### Use limitations

The Department of City Planning make no representation as to the accuracy of the information or its suitability for any purposes. The Department and the City disclaim any liability for errors that may be contained herein.

### Extent

<b>West</b>	-74.260380	<b>East</b>	-73.699206
<b>North</b>	40.917691	<b>South</b>	40.485808

### Scale Range

<b>Maximum (zoomed in)</b>	1:5,000
<b>Minimum (zoomed out)</b>	1:150,000,000

## LIST OF VALUES

VALUE 0

DESCRIPTION Street other than vehicle only street.

VALUE 1

DESCRIPTION Railroad

VALUE 2

DESCRIPTION Water Edge / Shoreline

VALUE 3

DESCRIPTION Census Block Boundary

VALUE 5

DESCRIPTION Paper Street: This is a legally mapped, but unbuilt street. Such streets are

common in areas of Staten Island anticipating development. May exist in all boroughs.

VALUE 6

DESCRIPTION Private Street: This is a physically existing street which is not owned by the City and is not officially mapped. For example, streets in the Fort Totten and Breezy Point sections of Queens.

VALUE 7

DESCRIPTION District Boundary: Physically non-existent boundary for a community district, a police precinct, or a fire company.

VALUE 8

DESCRIPTION Physical Non-Street Boundary: Physically existing un-addressable boundary (such as a rock wall cemetery edge).

VALUE 9

DESCRIPTION Paper Street and Census/District Boundary: A legally mapped, but unbuilt street that also acts as a census block or district boundary.

VALUE A

DESCRIPTION Alley: a narrow street or passageway between and behind city buildings.

VALUE W

DESCRIPTION Path, Non-Vehicular, Addressable: This is a walking path that contains addresses. For example, some boardwalks and some walking paths in housing projects.

VALUE C

DESCRIPTION CCO (Corporation Counsel Opinion). A CCO is an opinion by the City's Law Department that a street area, not owned by the City, has been dedicated for public use, consistent with the requirements of General City Law, Section 36(2). That allows the City to use public funds for various improvements and services, including paving of the roadway and installing sewers. The request usually relates to planned work by the City's Department of Transportation, Department of Design and Construction, and Department of Environmental Protection.

*Hide Field FeatureTyp ▲*

FIELD SegmentTyp ►

\*ALIAS SegmentTyp

\*DATA TYPE String

\*WIDTH 1

\*PRECISION 0

\*SCALE 0

FIELD DESCRIPTION

Segment Type: This field is used to define the segment's status in relation to the horizontal topology enhancements first introduced with LION 06A.

LIST OF VALUES

VALUE B

DESCRIPTION Both: Segment is both generic and roadbed; the center roadbed segment of a divided roadway containing an odd number of roadbeds.

VALUE C

DESCRIPTION Connector: Segments used to connect adjacent roadbeds of a divided street. Typically these exist to allow traffic flow from one roadbed to another.

VALUE E

**DESCRIPTION** Entrance/Exit Ramp: Connects a highway to a different street or highway.

**VALUE** F

**DESCRIPTION** Faux Segment: These are used when a street or ramp physically ends at a roadbed, but connectivity needs to be maintained with the generic segment.

**VALUE** G

**DESCRIPTION** Generic Segment: An imaginary single line representation of a physically divided street.

**VALUE** R

**DESCRIPTION** Roadbed Segment: Depicts physically separated carriageway segments of a particular street.

**VALUE** T

**DESCRIPTION** Terminator: Used to model situations where a divided section of a street terminates, but the street itself continues.

**VALUE** U

**DESCRIPTION** Undivided Street: All other LION segments that do not fall into any of the above categories.

**VALUE** S

**DESCRIPTION** Suppressed: Undivided segment to be suppressed in a generic view of LION

*Hide Field SegmentTyp ▲*

#### FIELD IncExFlag ►

- \* **ALIAS** IncExFlag
- \* **DATA TYPE** String
- \* **WIDTH** 1
- \* **PRECISION** 0
- \* **SCALE** 0

##### FIELD DESCRIPTION

Inclusion/Exclusion Flag: Field formerly used by DCP to identify pre-horizontal topology roadbeds in LION. This field is now used to flag selected pedestrian walkways and greenways for exclusion in the NYPD's ETL process from CSCL.

##### LIST OF VALUES

**VALUE** E

**DESCRIPTION** Segment should be excluded from the NYPD's ETL and from Geosupport cross street generation.

*Hide Field IncExFlag ▲*

#### FIELD RB\_Layer ►

- \* **ALIAS** RB\_Layer
- \* **DATA TYPE** String
- \* **WIDTH** 1
- \* **PRECISION** 0
- \* **SCALE** 0

##### FIELD DESCRIPTION

For cartographic purposes, indicates whether segment is present in the "Roadbed" layer and/or the "Generic" layer. This field is generated by a definition query of Segment Types.

## LIST OF VALUES

VALUE R

DESCRIPTION Segment is unique to the Roadbed layer. Comprised of Segment Types R, C and T.

VALUE G

DESCRIPTION Segment unique to the Generic layer. Comprised of Segment Types G and F.

VALUE B

DESCRIPTION Segment belongs in Both the generic and roadbed layers. Comprised of Segment types U, B and E.

VALUE N

DESCRIPTION Segment is neither in the generic or roadbed layer. These are exception cases where divided roadbeds existed in the LION file prior to release 06A.

*Hide Field RB\_Layer ▲*

## FIELD NonPed ►

\* ALIAS NonPed

\* DATA TYPE String

\* WIDTH 1

\* PRECISION 0

\* SCALE 0

## FIELD DESCRIPTION

Non-Pedestrian Indicator.

## LIST OF VALUES

VALUE D

DESCRIPTION Pedestrian accessible, but are excluded by the Department of Education in determining walking routes from a pupil's home to their school.

VALUE V

DESCRIPTION Vehicle-only: primarily roadways, inaccessible to pedestrian usage

*Hide Field NonPed ▲*

## FIELD TrafDir ►

\* ALIAS TrafDir

\* DATA TYPE String

\* WIDTH 1

\* PRECISION 0

\* SCALE 0

## FIELD DESCRIPTION

Traffic Direction. Code indicating the flow of traffic relative to the street segment's directionality.

## LIST OF VALUES

VALUE W

DESCRIPTION With: One-way street, traffic flows with the segment's directionality, i.e., from the segment's FROM node to the TO node..

VALUE A

DESCRIPTION Against: One-way street, traffic flows from against the segment's directionality, i.e., from the segment's TO node to the FROM node.

VALUE T  
DESCRIPTION Two-Way: Traffic flows in both directions.

VALUE P  
DESCRIPTION Pedestrian path: Non-vehicular.

VALUE blank  
DESCRIPTION Non-street feature.

#### FIELD SpecAddr ►

\* ALIAS SpecAddr  
\* DATA TYPE String  
\* WIDTH 1  
\* PRECISION 0  
\* SCALE 0

##### FIELD DESCRIPTION

Special Address Type Code. These represent special addressing situations. Please note that alternative street names and street codes for Special Addresses other than TYPE = 'A' can be found in the fields "SAFStreetName" and "SAFStreetCode" respectively.

##### LIST OF VALUES

VALUE A  
DESCRIPTION Alternate Address Range: Alternative address ranges for the same street name. This can occur where buildings have been renumbered; old numbers will sometimes remain in use. For example, such usage is common in some Queens neighborhoods, including Far Rockaway, Douglaston, Forest Hills and Ridgewood, where non-hyphenated addresses have been replaced by hyphenated addresses.

VALUE B  
DESCRIPTION Alternative Street Names: Alternative street names that cannot be handled in the usual way.

**VALUE C**

**DESCRIPTION** Handles a unique situation along the Brooklyn-Queens border, where Ruby Street on the Brooklyn side of the street is known as 75 Street in Queens. Some Brooklyn residents use 75 Street in their address; however there is another 75 Street in the Bay Ridge section of Brooklyn, far from the Queens border.

**VALUE D**

**DESCRIPTION** Duplicate Addresses: Duplicate addresses for the same street name within the same borough. Currently, there are three New York City streets that have some duplicate addresses: Hillside Avenue and Center Drive in Queens, and Martin Luther King Junior Boulevard in Manhattan. The portion of Hillside Avenue in the Far Rockaway neighborhood has some addresses that are identical to addresses in the portion of Hillside Avenue in the Douglaston neighborhood. Hillside Avenue also has some addresses that are duplicated between the Douglaston and Bellerose neighborhoods. Center Drive has some addresses that are duplicated between the Douglaston and Malba neighborhoods. Martin Luther King Junior Boulevard is an alternative name for both East 125 Street and West 125 Street, and therefore has many duplicate addresses.

**VALUE E**

**DESCRIPTION** Refers to situations in which the name of a neighborhood can serve as an alternate name for all streets in that neighborhood. The two neighborhoods for which this applies are both in the Bronx: Edgewater Park and Harding Park.

**VALUE G**

**DESCRIPTION** This is used for names of complexes (e.g., Lincoln Center). Complexes are non-addressable, and are composed of a number of non-addressable place names. Complexes can include individual buildings or parks that are recognized as a grouped entity (e.g., Lincoln Center, Jefferson Houses, City College). "G" records refer to the complex names (Lincoln Center), while the entities within the complex (Alice Tully Hall, Metropolitan Opera, etc.) are flagged as type "x" records.

**VALUE N**

**DESCRIPTION** Non-Addressable Place Name: This is used for non-addressable place names. These are place names that cannot be combined with a house number to form an address. Such place names can include individual buildings (e.g., City Hall, Alice Tully Hall), building complexes (e.g., Columbia University, New York Hospital) and large facilities (e.g., Penn Station, LaGuardia Airport).

**VALUE O**

**DESCRIPTION** This is used for out-of-sequence addresses. Such addresses do not follow the logical addressing sequence of the immediately adjacent buildings. For example, address number 62 of a street may exist between addresses 80 and 82, not between 60 and 64 on that blockface (it may also appear on a blockface other than that which contains 60 and 64). Also, the address may be an opposite-parity address, in that its parity (odd/even) is the opposite of the predominant parity on the blockface. For example, address number 62 may appear on the odd side of the street between 63 and 65.

**VALUE S**

**DESCRIPTION** Suffix: This refers to situations in which the break in addresses from one block face to the next along a street involves house number suffixes. The "s" flag appears with such records to denote that a suffix exists at either the low or high end of the segment's address range. For example, if the address range on one block is 1 - 13A, and the next block is 15 - 25, the address range on the first block will be shown in LION as 1 - 13, and 13A will be an SAF type "S" record.

**VALUE V**

**DESCRIPTION** This is used for "vanity addresses" (i.e. addresses in which the street name refers to a different street than the one on which the referenced building entrance is

actually located). For example, 1049 5th Avenue in Manhattan, a vanity address, is actually located on East 86th Street, between 5th Avenue and Madison Avenue.

VALUE X

**DESCRIPTION** This is used for names of non-addressable, constituent entities of complexes (not the entire complex name itself, which is flagged as type "G"). These are non-addressable place names grouped with other non-addressable place names to form a larger, non-addressable complex. Such non-addressable place name parts of complexes can include individual buildings or parks (e.g., Alice Tully Hall of Lincoln Center, Damrosch Park of Lincoln Center, Jefferson Houses Building 2 of Jefferson Houses, Shepard Hall of City College). To ensure that non-addressable place names are geocoded to the correct side of a street segment, the address range fields of the incorrect side of the street will contain a value of "-99999."

VALUE P

**DESCRIPTION** Addressable Place Names: An addressable place name is usually the name of an individual building or building complex that can serve the role of a street name in an address, even though there is no actual street with that name. Each of these can combine with address numbers to form addresses, such as 5 Penn Plaza or 13 Confucius Plaza.

*Hide Field SpecAddr ▲*

#### FIELD FaceCode ►

- \* ALIAS FaceCode
- \* DATA TYPE String
- \* WIDTH 4
- \* PRECISION 0
- \* SCALE 0

##### FIELD DESCRIPTION

Face Code: A four digit number assigned to any linear geographic feature in LION. This can be either a street or non-street feature (e.g., shoreline, railroad tracks). Also a component field of a unique identifier in LION known as the LIONkey (comprised of Boro, FaceCode and SeqNum).

*Hide Field FaceCode ▲*

#### FIELD SeqNum ►

- \* ALIAS SeqNum
- \* DATA TYPE String
- \* WIDTH 5
- \* PRECISION 0
- \* SCALE 0

##### FIELD DESCRIPTION

Sequence Number: A five digit number assigned sequentially to the street segments within a given face code. The sequence number generally increases with the directionality of the street. Also a component field of a unique identifier in LION known as the LIONkey (comprised of Boro, FaceCode and SeqNum).

*Hide Field SeqNum ▲*

#### FIELD StreetCode ►

- \* ALIAS StreetCode
- \* DATA TYPE String
- \* WIDTH 6
- \* PRECISION 0

\* SCALE 0

FIELD DESCRIPTION

Street Code is a numeric code that represents the names of New York city streets. The first digit is a borough code; the subsequent five digits are the 5-digit street code.

#### FIELD BOE\_LGC ►

\* ALIAS BOE\_LGC  
 \* DATA TYPE String  
 \* WIDTH 1  
 \* PRECISION 0  
 \* SCALE 0

#### FIELD DESCRIPTION

Board of Elections LGC Pointer (Domain values = 1, 2, 3, 4) indicates which LGC field (LGC1, LGC2, LGC3 or LGC4 respectively) corresponds to the name for this segment that is used for Board of Elections applications.

[Hide Field BOE\\_LGC ▲](#)

#### FIELD SegmentID ►

\* ALIAS SegmentID  
 \* DATA TYPE String  
 \* WIDTH 7  
 \* PRECISION 0  
 \* SCALE 0

#### FIELD DESCRIPTION

Segment ID: A seven digit number (right justified, zero filled) that identifies each segment of a street or a non-street feature represented in the LION file. Segment ID differs from the LIONKey (see FaceCode and SeqNum definitions) in that the former identifies a geographic entity, whereas the latter identifies a record in the LION file. In the case of a segment lying along a borough boundary (for example, the Brooklyn-Queens border), there will be two distinct LIONKeys (one for each borough), but the Segment ID in each LION record will be identical since it refers to the same physical geometry.

[Hide Field SegmentID ▲](#)

FIELD **SegCount** ►

\* **ALIAS** SegCount  
 \* **DATA TYPE** String  
 \* **WIDTH** 1  
 \* **PRECISION** 0  
 \* **SCALE** 0

## FIELD DESCRIPTION

Coincident Segment Count: Indicates situations where there are double-decker roads and therefore more than one segment for the same geography in LION (as it is maintained in CSCL). An example would be the upper and lower roadways of the George Washington Bridge. In this case, the SegCount would be equal to 2. Most LION segments will have a SegCount of 1. However there will appear to be some anomalies because of the difference in the way LION is maintained, and the way it must be exported. For example, the Department of City Planning maintains an associated Special Address file that links various types of special address records (described further down in this document) to the LION file. In the BYTES version of LION, the only way to include these special address records is by replicating the segment with alternate address information. The result can be multiple records with the same Segment ID while the coincident segment count remains '1'.

*Hide Field SegCount ▲*

FIELD **LocStatus** ►

\* **ALIAS** LocStatus  
 \* **DATA TYPE** String  
 \* **WIDTH** 1  
 \* **PRECISION** 0  
 \* **SCALE** 0

\* WIDTH 3  
\* PRECISION 0  
\* SCALE 0

##### FIELD DESCRIPTION

Three-digit Community District code for the left side of the street. The first byte is the Borough Code and the second and third bytes are the Community District Number (right justified, zero filled). For example, Community District 6 in Brooklyn would be represented as 306. There are 59 community districts in the City of New York, as well as 12 Joint Interest Areas (JIAs). The JIAs are major parks and airports that are not contained within any CD. For a full listing, please refer to the 'readme.txt' that is

included as part of the LION file download.

#### FIELD LATOMICPOLYGON ►

\* ALIAS LATOMICPOLYGON  
 \* DATA TYPE String  
 \* WIDTH 3  
 \* PRECISION 0  
 \* SCALE 0

##### FIELD DESCRIPTION

Left Atomic Polygon: An atomic polygon is a minimal polygon formed by most LION segments (exceptions include paper streets and alleys). "Minimal" means the polygon is not subdivided by LION segments (other than the noted exceptions) into smaller polygons. An atomic polygon can contain segments of various types in its interior: paper street segments (Feature Type = 5), dead end segments (LocStatus = I), land-hooked segments (LocStatus = H) and alley segments (Feature Type = A). Atomic Polygons numbers are unique within 2010 Census Tracts and are used as building blocks for many higher geographies.

*Hide Field RSubSect ▲*

#### FIELD SanDistInd ►

\* **ALIAS** SanDistInd

\* **DATA TYPE** String

\* **WIDTH** 1

\* **PRECISION** 0

\* **SCALE** 0

##### FIELD DESCRIPTION

Sanitation District Boundary Indicator. Normally, sanitation routes are defined by the community district (CD) and sanitation district subsection. For some streets that divide a CD, the same route will service both sides. This indicator defines which CD will service the entire street. The Subsection (LSubSect and RSubSect) is NOT affected by the sanitation district boundary indicator.

##### LIST OF VALUES

**VALUE** L

**DESCRIPTION** Left: For both sides of the street, the sanitation district is defined using the CD on the left side of the street.

**VALUE** R

**DESCRIPTION** Right: For both sides of the street, the sanitation district is defined using the

CD on the right side of the street.

VALUE blank

DESCRIPTION The sanitation district route for each side of the street is correctly identified using the CD and subsection fields for the corresponding side of the street.

#### FIELD ConParity ►

\* **ALIAS** ConParity

\* **DATA TYPE** String

\* **WIDTH** 1

\* **PRECISION** 0

\* **SCALE** 0

##### FIELD DESCRIPTION

Continuous Parity Indicator (Domain Values = L, R). A continuous parity segment has both odd and even addresses on the same side of the segment, and no addresses on the other side. In a LION record that represents a continuous parity segment, the odd and even address ranges are stored separately and the 1-byte code indicates on which side of the street the addresses physically exist.

\* **DESCRIPTION SOURCE**

ESRI

##### LIST OF VALUES

**VALUE** L

**DESCRIPTION** Odd and Even house number are both on the left side of the segment.

**VALUE** R

**DESCRIPTION** Odd and Even house number are both on the right side of the segment.

*Hide Field ConParity ▲*

#### FIELD Twisted ►

\* **ALIAS** Twisted

\* **DATA TYPE** String

\* **WIDTH** 1

\* **PRECISION** 0

\* **SCALE** 0

##### FIELD DESCRIPTION

Twisted Parity: Occasionally, the address parities along a street switch. If a 'T' value exists in this field, it indicates that the parities have changed since the immediately preceding segment of the same street (i.e., if odd addresses were on the left, now they are on the right).

\* **DESCRIPTION SOURCE**

ESRI

##### LIST OF VALUES

**VALUE** T

**DESCRIPTION** Indicates that the address parities along a street have switched since the immediately preceding segment of the same street (i.e., if odd addresses were on the left,

they are now on the right).

*Hide Field Twisted ▲*

**FIELD PhysicalID ►**

- \* **ALIAS** PhysicalID
- \* **DATA TYPE** Integer
- \* **WIDTH** 4
- \* **PRECISION** 0
- \* **SCALE** 0

**FIELD DESCRIPTION**

A unique ID assigned in order to aggregate granular geometry to represent a Physical View of the city's street network. In CSQL, segmentation is very granular in order to accommodate many types of physical and non-physical geometry. The Physical ID is a unique number used to identify a physically existing piece of geometry that may or may not be comprised of several Segment IDs. For example, E 28 Street between 2nd Ave and 3rd Ave in Manhattan would have 1 Physical ID although there are 3 segments defining that block face, with 3 separate Segment IDs.

*Hide Field PhysicalID ▲*

**FIELD GenericID ►**

- \* **ALIAS** GenericID
- \* **DATA TYPE** Integer
- \* **WIDTH** 4
- \* **PRECISION** 0
- \* **SCALE** 0

**FIELD DESCRIPTION**

A unique ID assigned in order to aggregate granular geometry to represent a Generic View of the city's street network. Streets that contain multiple carriageways or roadbeds (such as Queens Boulevard in Queens and Park Ave in Manhattan) are represented by multiple centerlines corresponding to each roadbed as well as an imaginary 'single' generic centerline.

*Hide Field GenericID ▲*

**FIELD NYPDID ►**

- \* **ALIAS** NYPDID
- \* **DATA TYPE** String
- \* **WIDTH** 7
- \* **PRECISION** 0

FIELD LLo\_Hyphen ►

\* ALIAS LLo\_Hyphen

\* DATA TYPE String  
 \* WIDTH 7  
 \* PRECISION 0  
 \* SCALE 0

#### FIELD DESCRIPTION

Low Value for the hyphenated address range beginning on the left side of the street segment. Left and right are defined relative to a street segment's direction. For streets that have addresses, the direction of a DCPLION street segment is determined by the direction of increasing address numbers. Note that this direction is unrelated to the street's traffic direction or its orientation relative to the points of the compass. The direction of streets with out address numbers, as well as non-street features, is assigned arbitrarily, but is consistent within the street feature. Direction can usually be determined by observing which way the SeqNum increases. Includes hyphenated addresses.

DESCRIPTION SOURCE  
 ESRI

DESCRIPTION OF VALUES Sequential unique whole numbers that are automatically generated.

FIELD **FromLeft** ▶

- \* **ALIAS** FromLeft
- \* **DATA TYPE** Integer
- \* **WIDTH** 4
- \* **PRECISION** 0
- \* **SCALE** 0

## FIELD DESCRIPTION

Low Value for the numeric address range beginning on the left side of the street segment. For all hyphenated addresses, the hyphen has been removed. To convert the before hyphen portion of the house number is multiplied by 1000 and then added to the after hyphen portion of the house number (e.g. 101-40 would be converted to 101040).
